

ENDOBAIR

ENDOSCOPIC DEVICES

NEEDLES FOR SCLEROSIS

Catheters for sclerotherapy of varicose veins within the gastrointestinal tract from means of vascular or submucosal injection in case of acute bleeding or as a preventative treatment.

- Disposable
- With anti-crushing, anti-collapse, anti-kinking Peck core
- High thrust Teflon sheath with Luer Lock fitting
- Dual core catheter construction, Teflon/peck
- Injection needle with locking mechanism, lock back and forth
- Tapered distal catheter tip
- Suitable for use with Histoacryl Fibrin

NEEDLE-FREE BIOPSY FORCEPS

Specially designed for videoendoscopes which allow even easier use with a retroversion tool, thanks to the particular sheath with which they are equipped.

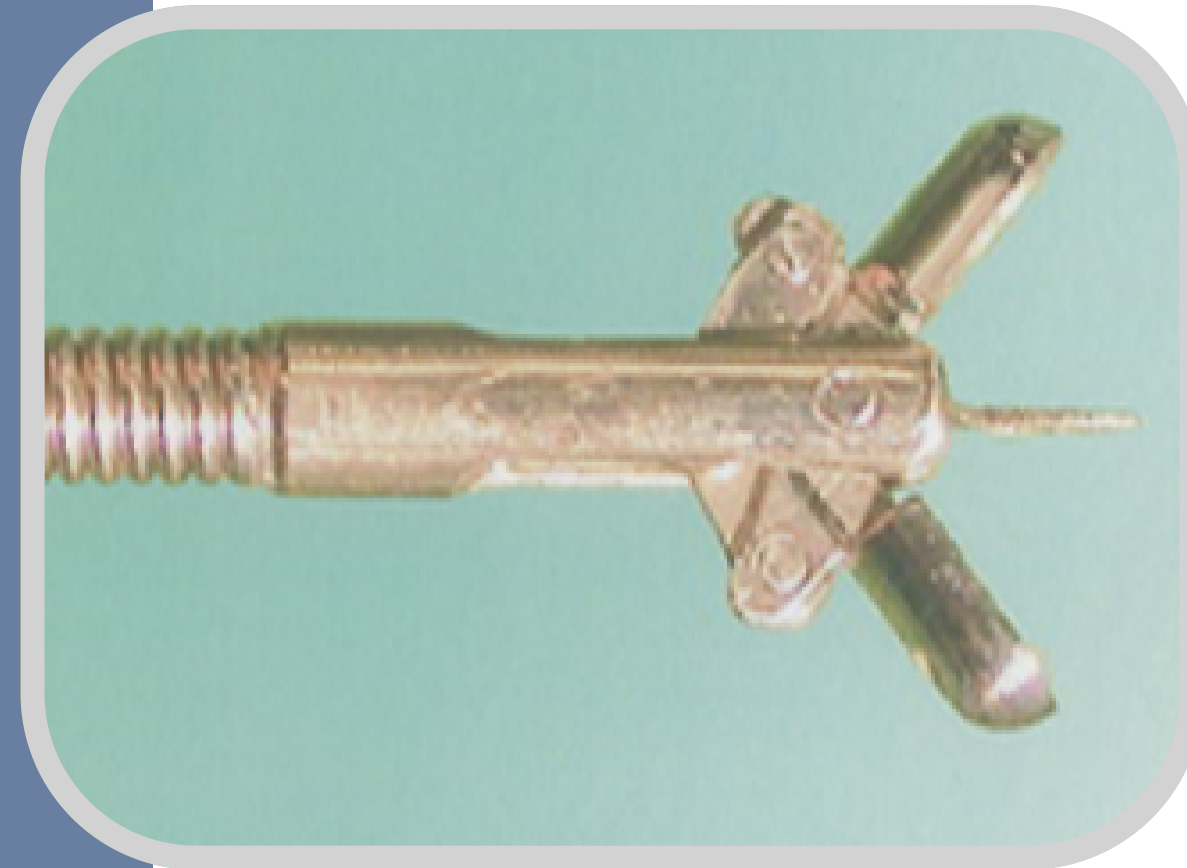

- Shirt/sheath (ghost sheath) built with a tapered shape from proximal to distal
- Without joints and/or welding points
- Exclusive anti-kinking system
- The pliers are equipped with a non-removable jaw steel
- Delrin handle

BIOPSY FORCEPS WITH NEEDLE

Specially designed for videoendoscopes which allow for even easier use with a retroversion tool, above all in the tapered version in the last 20 cm, thanks to the particular sheath with which they are equipped.

- Flexible and metallic sheath/sheath (phantom sheath) in stainless steel according to DIN 17442, allows use with rigid and flexible instruments
- Shirt/sheath (ghost sheath) constructed with a tapered shape from proximal to distal
- Free of joints and/or welding points
- Exclusive anti-kinking system
- The pliers are equipped with a non-removable steel
- Delrin handle

SPECIAL FORCEPS FOR BIOPSY

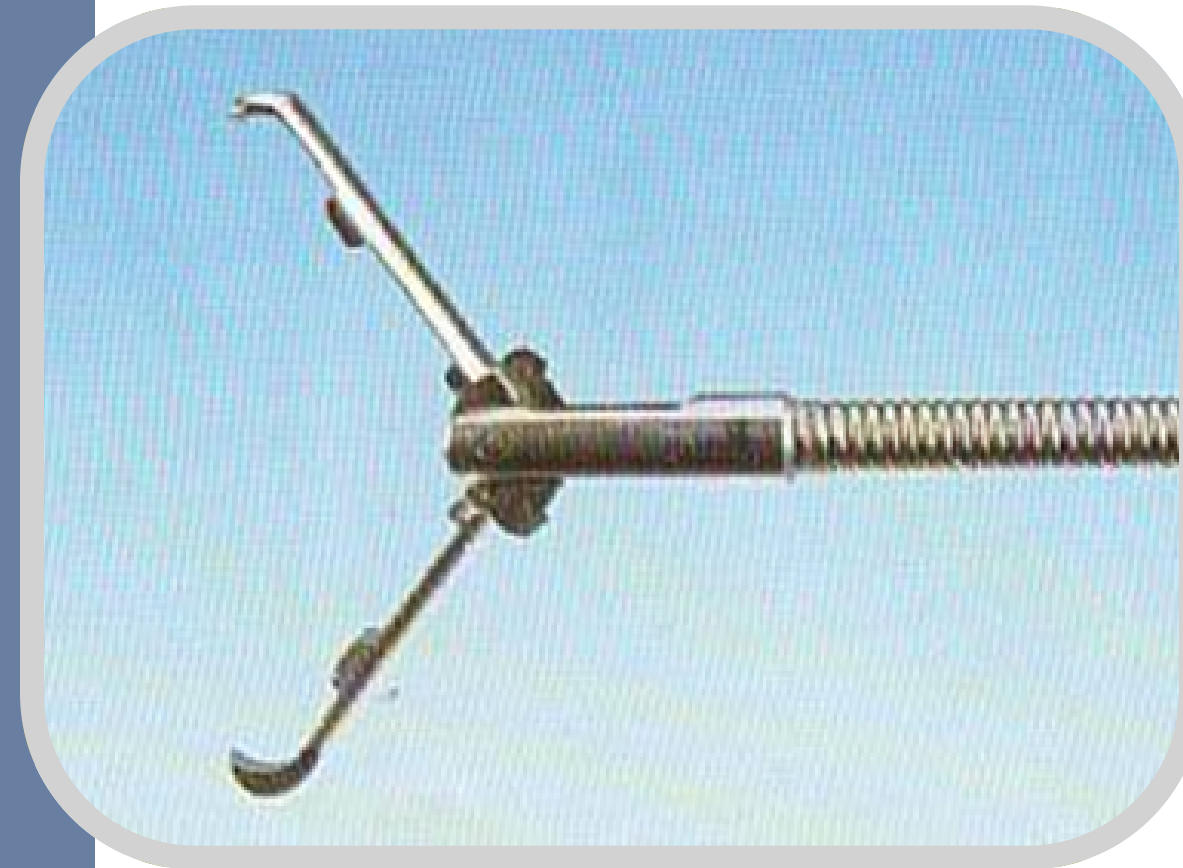

- Available with Teflon tube
- The four-wire rotating basket allows easy gripping of the stones
- The basket can reach up to an extraction force of 40 kg
- The particularly flexible metal wire allows easier access and precise positioning and at the same time particularly resistant for a firmer grip
- Equipped with distal extension for extra sheath guide wire technique
- Detachable handle
- Special anti-kink Teflon sheath.

POLYCATCH BIOPSY

Specially designed for videoendoscopes which allow easier use even with a retroversion tool, thanks to the particular sheath with which they are equipped.

- Flexible and metallic sheath/sheath (phantom sheath) in stainless steel according to DIN 17442, allows use with rigid and flexible instruments
- Sheath/sheath (phantom sheath) constructed with a tapered shape from proximal to distal, without joints and/or welding points
- Exclusive anti-kinking system
- The length of the 10 mm "arms" allows for easy grip of foreign bodies of large caliber and of any shape
- The terminal and central teeth allow easy gripping of the object and in particular
- The teeth on the tip facilitate the extraction maneuver, maintaining a firm grip
- The pliers are equipped with a non-removable steel and delrin handle

LOOPS FOR MUCOSECTOMY

- Oval configuration, with pre-formed curve memory
- Extra rigid monofilament characterized by hyper-cutting
- The particular curve memory preforming facilitates both operations, on sessile polyps and mucosal ablation
- The special anti-kink Teflon sheath is equipped with an LL fitting for secure anchoring to the handle, for better control of torsion and movement of the ring
- Detachable handle with HF attachment

BASKETS FOR LITHOTRIPSY AND STONE EXTRACTION

- Available with Teflon tube
- The four-wire rotating basket allows easy gripping of the stones
- The basket can reach up to an extraction force of 40 kg
- The particularly flexible metal wire allows easier access and precise positioning and at the same time particularly resistant for a firmer grip
- Equipped with distal extension for extrasheath guide wire technique
- Detachable handle
- Special anti-kink Teflon sheath
